

TASKER CARBON SCREEN TECHNOLOGY FOR INSTRUMENTS, MICROPHONES AND MORE!!

Tasker has developed Audio cables for many years and this experience brought us to the idea of a full range of carbon-screened cables.

Here below the high performance cables in this new line:

- C300 and C285: the smallest cables, having a diameter of 6,00 mm and respective nominal section of 0,22 and 0,50 mm², with carbon + spiral shielding.

Due to their high flexibility, they are ideal for live events.

- TSK1031 and TSK1032 with nominal section of 0,50 mm², diameter of 7,2 mm and respective shielding with carbon + spiral (TSK1031) and carbon + braid (TSK1032).

Due to their big dielectrics and the very low attenuation losses, they are ideal for studio records.

Special mention for a high performant cable, tasker TSK1030 that with its diameter of 4,60 mm boasts a triple shielding, nominal section of 0,20 mm² and outer soft touch textile braid. With his small dimensions, it is ideal for guitar multi-effects processors.

...But tasker carbon screen technology doesn't end here!

Starting from 2017 we are going to present new cables specifically designed for high performances on long distances. In facts, thanks to new active carbon screen technology we are able to reach cabling distances up to 500 meters, keeping the loss on the line at zero dB!

- TSK1026 has a diameter of 6,00 mm and a nominal section of 0,25 mm², with carbon + copper spiral shielding.
- TSK1028 has a diameter of 6,30 mm and a nominal section of 0,35 mm², with carbon + copper braid shielding.

All the cables described above are customizable with different kind of sheaths: L.S.Z.H., for fixed public installation, PE or PUR for Outdoor installations with or without metallic Armor for underground installation, even in presence of rodents.
